ENGLISH TRANSLATION

Chapter : 4

4.1. Now, I am describing the *Śodhana* and *Māraṇa* methods of metal (*dhātu*) of these some are as per my experience while some others are as per the *śāstras* (1).

4.2-3. Metals and their sub-groups

Metals are divided in three subgroups i.e. *suvarṇa* (gold) and *rajata* (silver) are known as *śuddha lohas*, *tāmra* (copper), *aśmaśāra* (Iron), *nāga* (lead) and *vaṅga* (tin) are known as *pūtiloḥas*, while *saurasṭra/kāṃsya* (belmetal), *rītī* (brass) and *vartaloha* (an alloy made of four metals) are known as *miśra lohas*. These (nine) types are known as subtypes of *lohas* (2-3).

Note: Metals are called as *dhātus* and also as *lohas*. Though, the author has mentioned the number of *dhātus* as eight (*ateṣṭau dhātavo*) but on counting these are nine.

4.4-21. Suvarṇa (Description of gold)

4.4-6. Suvarṇa Bhedaḥ (Varieties of gold): Gold are of two types:

1. *Rasaja* (through mercurial transformation) and
2. *Khanija* (through mines-mineral)

There are three other varieties of gold as per other texts but these are not mentioned here (4).

Rasaja gold: *Rasaja* gold is that which is obtained through the *rasavedha* (transformation through mercury). It is very beautiful and contains fourteen *varṇas* (*caturdaśa varṇāḍhya*). It may serve all the purpose of gold (5).

Khanija gold: *Khanija* gold is that which is obtained by mining from the mountains and/or plains at some places only. It is also associated with fourteen colours (6).

4.7-11. Śodhana method (Purification of gold)

Purpose of Śodhana

When gold is found mixed with silver etc. metals then with that gold *svaṛṇa kārya* (purposes of gold) can not be achieved, hence the experienced physicians recommended its *śodhana* (7).

Process

For this first prepare the *patras* of inferior quality gold, then prepare a paste of *khaṭikā* (chalk) and *paṭu* (rock salt) with *kāñjika* liquid by grinding, then this paste is to be applied on the gold leaves, close these in *saṃpuṭa* which is then kept on a furnace (small) and applied heat with forest dung cakes. In this way three *puṭas* (heating) are to be given and then collect the purified gold (8-10).

It is further said in this text that if pure gold is available then that gold should also be processed for *śodhana*. In general the the *śodhana* process is recommended for other metals (11).

4.12-20. Svaṛṇa māraṇam (Incineration of gold)

First Method

Gold *patras* should be heated and quenched in *jvālāmukhī rasa* for sixty times. By this method gold leaves convert into *bhasma* form. My teacher has told me that gold *bhasma* prepared by this method becomes *niruttha* definitely and on internal use it may destroy all the diseases and there is no room for any doubt (12-13).

Second Method

Prepare fine gold leaves percible by niddle, apply a paste on these *patras* prepared with *bhasma sūta* and *purāṃbu* (*rasa sindūra* and *guggulu* water). On drying close these in a *saṃpuṭa* and apply ten *puṭas* (*kapoṭa* to prepare *niruttha bhasma* of gold), it is made without any doubt (14-15).

Third Method

Prepare the fine gold leaves first similar to *bhūrjapatra*. These should be pasted with a paste prepared with equal part of *hiṅgu*, *hiṅgula* and *vajrī* (*snuhī*) *dugdha*. Then on drying close these in *saṃpuṭa* and apply heat with *kukkuṭa puṭa*. Repeat the heating process for ten times. By this method red coloured *svarṇa bhasma* similar to the colour of *rakta gairika* is prepared undoubtedly (16-17).

Fourth Method

Sūtabhasma prepared with *lohaparpatikā* method may be added with melted gold in equal amount. It converts the gold similar to *bhasma* in appearance. Now mix this *bhasma* with *hiṅgula* and *guggulu* water and grind it for one day. On drying, close it in a *saṃpuṭa* and apply ten *kukkuṭa puṭas*. By this method *sindūra* coloured gold *bhasma* is prepared with out any doubt. It certainly makes the *rañjana* of *deha* (body), and *lohas* (metals). The rich persons like to prepare this type of gold *bhasma* (18-20).

4.21. Properties of Gold Bhasma

This gold *bhasma* when used internally certainly improves complexion or the beauty of the body. Destroys *daivakṛta rogas* (small pox, *kuṣṭha* etc.) and all the *tridoṣajanya* diseases. And the man who uses it continuously for twenty (20) years never becomes old rather remains always youthful. And for such persons the chances of being affected of *garaviṣa* and the manifestation or the onset of *āgantuka rogas* are not there. That means these will not become affected with the effects of *garaviṣa* and *āgantuka rogas*.

4.22-34. Raupya (Description of silver)***Raupya Bhedaḥ* (Varieties of silver)**

The ancient scholars have described the three varieties of silver, viz, I. *khanija*- (mineral), II. *sahaja* (natural) & III. *kṛtrima* (artificial) (22).

- I. ***Khanija silver***: That which is obtained from digging of the mines of some mountains. It is known as *khanija* silver (23½).

- II. **Sahaja silver:** That which is produced or obtained from the *śikhara* (peaks) of *Kailāśa* hill is known as *sahaja* silver (natural silver) (23).
- III. **Kṛtrima silver:** It is prepared from the transformation of tin metal through the *vedha* process of mercury. Such silver is known as *kṛtrima* silver. That mean the silver obtained from the transformation of lower metals through the effect of mercury is considered as *kṛtrima* (artificial) silver (23).

Physical Properties: That which becomes *ujjvala* (brighter or whiter) on heating on fire is considered as *śuddha* silver. *Kaladhauta* is its synonym. It is considered best and may be used for all purposes and it may perform all the *kāryas* (actions) of silver (24).

4.25-27. Śodhana Method of Raupya (Purification of silver)

Causes and effects of aśuddha raupya: When silver is associated with copper etc. (metallic impurities) it is considered *aśuddha* or *miśra raupya*. And it is full of *doṣas* (bad effects) or produce a number of bad effects hence such silver requires purification (25).

Purification method: For this silver should be mixed with lead in a *mūṣa* and heated strongly. The scholars are of the opinion that for silver purification, six times of lead should be mixed with it and then apply strong heating with care. The *dhamana* should be done slowly and should be continued till it becomes *doṣaśūnya* (free from the *doṣas* i.e. impurities). The author has mentioned here that so purified silver may be used for all purposes and it may give success in all *karmas* (26-27).

Note: Though, the author has claimed much about this *śodhana* method but it is not very popular amongst *vaidyas* who often use silver in the preparation of medicines.

4.28-33. Raupya māraṇa method (Incineration of silver)

First Method

Take one part of silver and four parts of mercury. Grind it well with *niṃbu vari* (lemon juice) for one day to convert it into *piṣṭi* form. Then this *piṣṭi*

should be kept in a *mūṣā*, keeping sulphur below and above. Now fix it in *baluka yantra* and apply strong heat for one day carefully. On self cooling mix *tālaka* to it, grind well with an *amla drava* on a stone plate. On drying it should be closed in a *śarāva saṃpuṭa* and apply heat by *puṭa* system. Repeat the *puṭa* heating for twelve times. By this method certainly good quality *rajata bhasma* is prepared (28-31½).

Second Method

Take *śuddha* silver chalcopyrite in equal quantity, triturate these with *amla drava* (lemon juice), prepare their pilletes and apply *kukkuṭa puṭa* heating. Such twenty *puṭas* convert silver in *bhasma* form definitely (31½-32).

General statement of the author with regards to number of *puṭas*: In case of metals the application of more number of *puṭas* make these more effective and help in developing the particular colour in the particular *bhasma*, i.e. either red or white colour. It means more number of *puṭas* make the *rañjana* of metals more better (33).

4.34-35. Pharmaco-therapeutic Properties of *Raupya Bhasma*

The *bhasma* of *śuddha rajata* (silver) may be used internally mixed with *madhu* and *ghee*. It is known to cure eye diseases, *kṣaya roga*, *pittaja roga*, *kāsa* and chest diseases, *pāṇḍu roga*, *udara roga* and the diseases caused due to *prokopa* of all the *doṣas* and also in *arūci* (unrelishness) (34-35).

4.36-56. *Tāmra* (Description of copper):

4.36-37. *Tāmra bhedaḥ* (Varieties of copper):

Tāmra is of two types:

1. *Nepālaja*, 2. *Mlecchaja*

***Nepala tāmra*:** That which is obtained from *Nepāla deśa* is called *Nepālaja*. It is considered best.

***Mlecchaja tāmra*:** That which is obtained from the places other than *Nepāla* is called as is suggested by scholars *Mlecchaja tāmra*. It is considered inferior as is suggested by scholars (36).

Tāmra śodhanam (Purification of copper): Its *śodhana* (purification) should be done either like *sīśaka* (lead) or like *rajata* (silver) and there after its *māraṇa* (incineration) should be done by the *rasa* experts (37).

4.38-52. *Tāmra māraṇam (Incineration of copper):* Prepare thin leaves of copper first and put these in between *kanyāpatra* (leaves of *ghṛta kumārī*) in earthen lids. Close and seal them carefully and apply *kukkuṭa puṭa* heat. This is a type of *śodhana* method only (38).

First Method

For this prepare a *piṣṭi* of mercury and sulphur first, grind it with *niṃbu toya* (lemon juice) and apply it as paste on *tamra patras*. Close these in a *sthāli* (wide mouth pot) and apply heat for four *yāmas* (12 hours). By this method copper *bhasma* free from five *doṣas* is prepared (39-40).

Second Method

In this method take mercury and sulphur equal to copper separately and take *tālaka* (orpiment) half to copper and *śilā* (realger) half to orpiment. Mix all together and prepare a black powder like *kajjala* (soot) by grinding. This is recommended by medical experts. Now place purified copper leaves pieces first in *sarāva* and then *kajjali* over these leaves. Close the *sarāva sampuṭa* and apply heat through ‘*garbha yantra*’ for one *yāma* (3 hours). On self cooling remove the *yantra* from furnace and collect *bhasma*. It is then ground to fine powder form in a mortar. It should be used mixed with honey alongwith suitable *anupāna* (41-44).

Third Method

Prepare the *patras* (thin leaves) of purified copper, then take purified sulphur and purified mercury each equal to copper, purified *tālaka* half to copper and *śilā* half to *tālaka*. Then take *laṅgālī*, *citrake*, *vyoṣa*, *tālamūlī*, *karañjaka*, *viṣa*, *saṃyāka*, *ativiśā* and *saindhava* in equal quantity and prepare their powder, and then apply the *bhāvanā* of *jaṃbīra drava* to prepare their *kalka*. Put this *kalka* in a *śilābhāṇḍa* (stone pot). Now place the thin copper leaves pasted with *rasa* (*kajjali*) in that *kalka* and keep it for seven days. By this method

copper *bhasma* is prepared. It should be powdered and mixed with honey, *ghee* and two *pippalī cūrṇa*. It may be used internally in one *balla* (3 *ratti*-375 mg.) dose to destroy *jarā* and *mṛtyu* (old age and death). This compound is known as *somanātha tāmra bhasma* and has been described by Śrī Somadeva (45-49).

Fourth Method

Take purified copper and purified sulphur in equal amount, put half part of sulphur in a *sthālī* and then place copper leaves on it carefully and then put remaining half part of sulphur on it. Close the mouth of the *sthālī* with a small vessel containing lime. Seal the joint with a paste of *saindhava* and soil. Place it on the furnace and apply heat for three *yāmas*. On self cooling collect copper powder free from *doṣas* (bad effects), grind it and sieve it with fine cloth. It should be used internally in one *balla* (3 *ratti*-375 mg.) dose to cure *kāsa*, *śvāsa*, *gulma* and *prameha* (50-52).

Note: *Somanātha tāmra* is a famous copper preparation but in the formula mentioned by the author of *Rasapṛakāśa Sudhākara* the heating is not advised and without that whether copper would be converted into a suitable compound or not is doubtful. Where as in the other formulas mentioned in other *Rasa* texts heating through *bālukā yantra* was advised and by following that method the author has also prepared *somanātha tāmra bhasma* and had found it to be of good quality. The late vaidya śrī Jīvarām Kālīdāsa of Gondal had also expressed the same views in his Gujrati commentary on *Rasa Prakāśa Sudhākara*.

4.53-56. *Tāmra bhasma guṇāḥ* (Properties of copper *bhasma*)

Tāmra bhasma used in one *valla* dose internally cures *pariṇāma śūla*, *aṣṭavidha udara rogas*, *pāṇḍu roga*, *śofa roga*, *gulma roga*, *plīha roga*, *yakṛdjanya roga*, *agnisāda (mandāgni)*, *kṣayaja roga*, *prameha* and *gradāṇī* etc. many diseases with different *anupānas* (53-55½).

Generally *tāmra bhasma* is advised for internal use mixed with *pippalī cūrṇa* and *madhu*. And as such it can destroy all the *doṣas* and the diseases produced by these. Specially copper *bhasma* may destroy *aśās*,

ajīṛṇajanya rogas and *jvara rogas* etc. It may also prove very good in destroying *bṛddhi roga*, *śvasana janya rogas* and various types of *kāśas*. It is a best *rasāyana* and prevents/destroys *jarā* and *mṛtyu* (senile diseases and death) (53½-56).

4.57-78. *Loha* (Description of Iron)

Loha bhedaḥ (Varieties of Iron)

Kānta, *tīkṣṇa* and *muṇḍa* are the three main varieties of *loha*. These are inferior in colour and properties strictly in preceeding order i.e. *tīkṣṇa* is inferior to *kānta* and *muṇḍa* to *tīkṣṇa*. It has been claimed by the experts (57).

Kānta bhedaḥ [Varieties of *kānta loha* (magnetic iron)]

Here *kānta* is said to have four varieties, 1. *Romaka*, 2. *Bhrāmaka* 3. *Cumbaka* and 4. *Samdrāvaka*. Of these last (*saṃdrāvaka*) is considered best as per the experts of *Rasasāstra* (58).

1. ***Romaka***: While digging the mines a few stones of *kānta pāṣāṇa* comes out and the iron obtained from their melting is known as *romaka kānta loha* (59).
2. ***Bhrāmaka***: In a few selected mountains *bhrāmaka* stones are available and the Iron extracted from those stones is known as *bhrāmka kānta loha* (60).
3. ***Cumbaka***: In Vindhya range of hills some stones are available which attracts iron pieces and do not leave them easily like that of *bhakti* by the devotees of Lord Śiva (61).
4. ***Drāvaka***: It is rarely available in Himālayan hills. It can liquefy the iron pieces or even gold metals etc. on touching and the iron obtained from such stones is known as *drāvaka kānta loha* (62).

Śuddha kānta loha lakṣaṇas: (Characters of pure *kānta loha*)

1. In the vessels made of pure *kānta loha* the boiling milk does not comes out even on strong heating.
2. The water boiled in such vessel develops a smell similar to *hīṅgu* (63).

3. The oil drops put on the water filled in *kānta loha* vessel do not spread as usual and the oil does not sticks to the vessel. These are the signs/characters of *śuddha kānta loha* (64).

Uttarottara śreṣṭhatva: (Superiority of loha varieties in sequence)

On superiority point, *tīkṣṇa loha* is hundered times better than *muṇḍa loha*, and *kānta loha* is further very much better than *tīkṣṇa loha*. Amongst the varieties of *kāntaloha*, *cumbaka* and *drāvaka* are crore times better than *romaka* and *bhrāmaka* varieties (65).

Loha śodhana (Purification of iron)

First Method:

Anoint the sheets of *kānta lohas* etc. with the blood of rabbit and heat for seven times. By doing so (anointing and heating) all the *lohas* become purified without any doubt (66).

Second Method:

Anoint the paste of *sāmudra lavaṇa* on the sheets of iron and quench these in *triphalā kvātha* after strong heating. Repeat the process for seven times. By this way iron becomes purified. It is as true as the statement of teacher (67).

Loha māraṇam (Incineration of iron)

First Method:

Put *loha cūrṇa* mixed with *ghee* in an iron pan and apply heat rubbing it with an iron ladle, continue the process till it turns red like fire. Repeat the heating in an iron pan for five times. Then it should be ground well with *triphalā* decoction and apply four *gajapuṭas*. On cooling grind it well. This *loha bhasma* definitely becomes *vāritara* (iron ash flodable on water surface). By this method all the *lohas* should be treated for their *māraṇa*. And so prepared *loha bhasmas* destroy all the *rogas* and also *palita* (greying of hairs) (68-71½).

Second Method

Take *loha cūrṇa* (purified) two *palas*, *guḍa* and *gandhaka* equal to *loha*. Mix all well in a mortar by grinding and apply *puṭas* (heatings) for twenty times. During *puṭapāka* first the material should be ground well and then *puṭas* should be given. By this way all the *loha* (metals) certainly convert into good quality *bhasma* form. And so prepared *bhasmas*, definitely destroy all the diseases. While preparing *loha bhasma*, if the *bhāvana* of *śveta punarnavā patra* juice is given and ten *puṭas* are applied then the colour of *loha bhasma* becomes red like that of *sindūra* (71½-74).

Third Method

There is another method of *loha māraṇa* which is being described as follows:-

Take the *gandhaka* powder equal to *loha cūrṇa* and grind well with *kānya* juice and prepare its *piṇḍa* (*bolas*) and keep it in a shade for long time (6 months) in an iron vessel. By this method *loha māraṇa* is done, there is no doubt. And it is also my experience, says the author (75-76).

Loha bhasma gunah (Properties of *loha bhasma*):-

Niruttha loha bhasma used internally mixed with *vyosa* (*trikaṭu* powder), *vella* (*veḍaṅga*) *cūrṇa*, *madhu*, and *ghee* in a dose of one *taṅka* (3 *māṣakas* – 3gms) prevent *jarā* (old age) *mṛtyu* (death) and *vyādhies* (diseases), it gives *putras* (male child) to both the sexes and cures the diseases caused due to the effect of old age of the persons, as said by experts (77-78).

Baṅga (Description of tin metal)

4.79. *Baṅga bhedaḥ* (Varieties of *baṅga*);

Vaṅga is of two types, i.e. 1. *Khura vaṅga* and 2. *Miśra vaṅga*. Of the two that which is pure, straight and white is called *khura vaṅga*. It is superior and recommended for medicinal uses (79).

Baṅga śodhanam (Purification of tin metal)

The *khura* variety of *baṅga* melted and poured in the oil extracted from *bhallataka*, becomes pure.

The *miśra* variety of *baṅga* should be melted and poured in *takra* mixed with *punarnavā* powder, *saindhava* and *vatsanābha* powder for three times. In this way *miśra vaṅga* becomes purified (80).

Baṅga bhasma māraṇam: (Method of incineration of tin)**First Method**

Take a big dung cake, made a whole in its middle, put *ciñcātvak* powder in it, prepare a pillet of *Baṅga* amounting one *karṣa* (about 10 gms) in wt. Put it on the powder, cover the *baṅga* pillet with four times above mentioned powder. Put another dung cake on it and apply *puṭāgni* (*gajapuṭa* heat), on self cooling, this pillet should be taken out. Grind it to powder form and this *Baṅga bhasma* may be used for all purposes. By this method if some portion of tin metal remains as metal (not reduced to ashes) may be treated again as above for complete *māraṇa* (81-83).

Second Method

Now I will describe another method for *baṅga maraṇa* as follows:

Prepare equal size *patras* of *śuddha baṅga*. Also prepare a powder of *ajā śakṛt* (fecal matter of goats), *triphalā* and *haridrā* taken in equal parts. Now dig a pit (quadangular) having one hand width and depth. Fill half portion of this pit with dung cakes, spread a piece of *śana* (jute) cloth over it then spread the powder prepared separately over it. Put *baṅga patras* all over it. Place the remaining powder over the *baṅga* sheets carefully, then fill the remaining portion of pit with dung cakes and fire it like *puṭapāka*. On self cooling collect the *baṅga bhasma* (84-88).

Method of preparing *rasabaṅga*:-

For this grind the above mentioned *mṛtabaṅga* with the juice of *bījapūra* (a variety of lemon). Mix equal quantity of *rasa sindūra* with it and grind well in a mortar and fill it in a *kācakūpī* and apply heat for sixteen *yāmas* (48 hours). By this way *mṛtabaṅga* becomes like *hema* (gold) in shining and is known as *rasabaṅga* (This may also be known as *svarna baṅga*) (89-90).

Properties (Pharmaco-therapeutic) of *rasabaṅga*

Baṅga is considered as *vātakara* (*bātavardhaka*), *rūkṣa* in *guṇa*, *tikta* (bitter) in *rasa*, destroys *meha* (*premehas*), removes *medas-medo roga* (excessive fat), *kṛmi roga*, *kapha doṣa*, *viṣa doṣa* and *āpa doṣa* and almost all the diseases. It gives *śakti* (strength) and possess many other properties. Its dose is one *balla* (250 to 375 mg.) and may be given internally according to severity of diseases and strength of the patient. It is further said in this context that *baṅga bhasma* is specific of right type of *vāta rogas* and twenty types of *meha rogas* if used internally for one week only (91-93).

4.94-102. *Nāga* (Description of lead)**Physical properties of superior *nāga* (lead)**

That which looks black on cutting, heavy in weight, *snigdha* (smooth) on touch, melts quickly, looks *ujjala* (bright) and black from out side is considered *śuddha nāga* (pure lead) and that is useful, not otherwise (94).

***Nāga śodhanam* (method of purification)**

For this lead should be poured in the juice of *nirguṇḍī* mixed with *haridrā cūrṇa* (for 3-7 times). And so purified lead may not cause *mūrcchā* (unconsciousness) and *sphoṭa* (breaking of the skin), toxic effects on internal use etc. (95).

Nāga māraṇam* (Incineration of lead)*First Method**

Prepare thin *patras* (leaves) of purified lead, prepare a paste of *manah śilā* (realgar) by triturating it with *vāsārasa* for one *yāma* (3 hours). Anoint this paste on the leaves of lead already prepared. On drying close these in *śarāva samṇpuṭa* and apply strong heat through *varāhapuṭa*. Repeat the process for three times and by doing so lead *bhasma* is prepared (96-97).

Second Method

The *nāga bhasma* may also be prepared with another method. For this melt *nāga* (lead) in an iron pan and rub it with iron ladle sprinkling the powder of *palāśa mula* (root of *palāśa*) carefully for four *yāmas* (12 hours) applying strong heat from down to the pan. By this method lead turns to ashes definitely. On applying more heating it turns into reddish powder and may be used for all purposes (in all the diseases). It can always destroy diseases. It is said further by the author that many scholars have told many methods for the *māraṇa* (incineration) of *nāga* but in reality there is no method by which one can do the *māraṇa* of lead and mercury in complete sense except lord Śiva (98-101).

***Nāga bhasma gunāḥ* (Properties of lead ash)**

It can destroy all the *premaḥa rogas*, *vātaja rogas*, specially *dhanur-vāta rogas* etc and also twenty types of *śleṣmaja* (*kaphaja*) *rogas* undoubtedly (102).

4.103-108. *Pittala* (Description of brass)***Pittala bhedaḥ* (varieties of *pittala*)**

Pittala is of two types:

1. *Rītikā* and 2. *Kākatuṇḍī* (103½).

Characteristics of each variety:

That which turns on heating and quenching in *tuṣajala* (*dhānyāmla*-an acidic liquid) is known as *ṛtikā*, and which turns black on heating and quenching in *kāñjika* is known as *kākatuṇḍī* (103½).

Physical properties of superior/inferior quality

Which looks yellowish, soft, heavy and like a *sāra* (iron), golden yellow in colour, smooth and oily on touch is considered superior or acceptable for therapeutic uses (104).

Which gives bad or foul smell, rough on touch, *pāṇḍura* (whitish) in colour, can not stand to hammering and has dry surface is considered inferior and not recommended for *rasāyana* purposes (105).

***Ṛtī Śodhana* Method**

Fine leaves of brass should be heated strongly and quenched in *nirguṇḍī* juice with care. By repeating the process for five times *ṛtī* becomes certainly purified (106).

***Pittala bhasma vidhi* (Method of incineration of brass)**

The purified leaves of brass should be anointed with the paste of *manah śilā* (realger), *gandhaka* (sulphur) and *sindhūttha* (rock salt) prepared with lemon juice. Apply *gajapuṭa* heat in *sarāva sampuṭa*. Repeat the process for eight times to convert brass into an ash form.

It should be used for *rasāyana* purpose (107).

Pharmaco-therapeutic properties

Ṛtikā is *rūkṣa* in *guṇa*, *kṛmighne* in *karma* and destroys *raktapitta*. *Kākatuṇḍī* is used in *vīrya*, *sara* in *guṇa* and *kuṣṭhahara* in *karma* (108).

4.109-111. *Kāṁsya* (bell metal)**Formula of *kāṁsya*-making**

Mix one part of best quality tin metal with four parts of superior quality copper by melting both. By this formula good quality bell metal can be prepared. The *kāṁsya* prepared in Saurāṣṭra is considered to be the best (109).

Śodhana-māraṇa method

Kāṁsya heated strongly and quenched in cow's urine for seven times becomes purified.

Purified *kāṁsya* mixed with *haritāla* and *gandhaka*, and triturated with lemon juice turns into an ash by applying five *puṭas* (*gajapuṭas*) (110).

Properties of *kāṁsya bhasma*

Kāṁsya reduced to an ash pacifies *vātadoṣa*, destroys *pramehas*. It is also said here that all types of foods except *amla*, *ghṛta* and *śāka* if put in *kāṁsya* *pātra* turns *pathya* (acceptable to the body) (111).

4.112-115. *Varta loha/viḍa loha* (an alloy of four metals)

Varta loha can be prepared by mixing *loha* (iron) *kāṁsya* (bell metal) *arka* (copper) and *ṛti* (brass). The scholars also call it as *viḍa loha* (112).

Śodhana-māraṇa method

Varta loha heated to melting and poured into horse urine becomes purified. The process may be repeated for seven times. *Varta loha* mixed with *gandhaka* and *tālaka* and applied heating by *puṭa* system becomes *mṛta* (converts into an ash) (113).

Properties of *varta loha bhasma*

It pacifies *kapha* and *pittadoṣa*, *amla* in *rasa*, *rucikara* and *kṛmihara* in *karmas*, destroys *netra rogas* and *gala rogas* (114).

Every thing put in this pot becomes *pathya* (acceptable to the body) except *kṣara* and *amla padārthas*. These materials if put in this vessel prove best *sarvadoṣahara*, *agni-dīptikara* (stimulant to digestive fire) and *pācana* (digestion promotor) (115).

4.116. Upsamhāra (Conclusion)

In this chapter I have mentioned the best *śodhna* and *māraṇa* methods, and the good and bad properties of metals carefully after consulting many texts in detail and whatever I have experienced (in my life) (116).

ENGLISH TRANSLATION

Chapter : 5

5.1-2. Now in minerals *mahārāsa* group of drugs are described first because of their superior or better properties. Their names, groups, *satva-pātana* and properties are being described here serially.

The names of *mahārāsa* group of drugs are: *Abhraka Gagana* (mica), *Rājāvarta* (lapis lazuli), *Vaikrānta* (turmaline/manganese ore), *Sasyaka* (copper sulphate ore/blue vitriol), *Tāpya/Mākṣika* (chalcopyrite), *Vimala* (iron pyrite), *Śaila saṁbhūta* (asphalt/mineral pitch/bituman), *Rasaka* (zinc blend/zinc ores).

The experts of *rasaśāstra* have mentioned these eight *mahārasas* in this text (1-2).

5.3-7. Abhraka gagana varṇanam (Description of mica) (I):

Now according to serial order, I am describing *gagana* first which is of four types as per colour:

Varieties: 1. *Śveta* 2. *Rakta* 3. *Pīta* and 4. *Kṛṣṇa*.

The white one is suitable for *śveta krityā*, *rakta* and *pīta* are suitable for *pīta karma* while *kṛṣṇābhra* is always considered suitable for *rogaharaṇa* (curing of diseases). Each of these are again subdivided in four sub-varieties: 1. *vajra* 2. *pināka* 3. *nāga* and 4. *maṇḍūka*. In this way sixteen varieties of *abhraka* have been mentioned here. Out of these four *abhraka* sub-varieties, the *vajra* variety is the best and remaining three are not considered good for use, as these are likely to produce severe types of diseases, hence by the good physicians these have always been discarded (3-7).

5.8-12. Characteristics

Vajrābhra

Vajrābhra variety when heated strongly on fire never develops any *vikṛti* (change in shape and form) and on internal use, it makes the body as strong as *vajra* (the weapon of Lord Indra) and checks even death.

Pināka

Pinākābhra variety when heated on fire gets its layers separated or gets expanded. On internal use, it produces *kṛmi* and *kuṣṭha rogas* within one month.

Nāgābhra

Nāgābhra variety when heated strongly on fire produces hissing sound like that of snake and on internal use it produces *kṣayaroga* (wasting diseases) which may prove fatal in due course of time just like drunken *hālāhala viṣa* (a variety of very virulent poison). It is the opinion of experienced physicians.

Maṇḍūkābhra

Maṇḍūkābhra variety when heated strongly on fire does not remain quite rather always makes movement like a frog (breaks into pieces and jumps from fire like frogs). And according to experts of *rasaśāstra* it is also not recommended for internal use (8-12).

5.13-15. Śodhana process of Abhraka :

First Method: For *śodhana*, *abhraka* should be applied *svedana* (heating) in boiling *kāñjika* or in acidic liquid for one day followed by *svedana* in *kulattha kvātha*, *takra* (butter milk) and *vājī mūtra* (horse urine). Heating as above makes it purified and free from *doṣas* (impurities).

Second method: *Abhraka* should be made red hot on fire and quenched in *kāñjika* for seven times. This method also makes it free from various *doṣas* (impurities). In the same way it should also be quenched in *varā* (*triphala*) *kvātha*, cows milk, cow's urine and *bhṛṅgarāja rasa* for making it *doṣasūnya* (free from impurities) (13-15).

5.16-25. Māraṇa process of Abhraka:

First method: Make a fine powder of *śuddha abhraka*, triturate it with *haṃsāpādi rasa*, prepare its round flat pillets, dry and close these in a *saṃpuṭa* and apply six half *gajapuṭas*, then mix 1/4th part *śuddha tañkaṇa* with *abhraka*

and triturate with *punarnavā rasa*, prepare its pillets and apply seven half *gajapuṭas*, in same way give seven *ardha gajapuṭas* with *tanḍulīya rasa* and seven with *vāsā rasa*. By this method *candrikā rahita* (shining less) and *sindura* like red coloured *abharaka bhasma* is prepared without any doubt. In total 27 *puṭas* are applied (16-19).

Second method: In this the use of *dhānyābhraka* is recommended. It is to be triturated with *kāsamarada rasa* and applied hundred *puṭas*. By this method also good quality *abhraka bhasma* is prepared (20).

Third method: In this method *ṭaṅkana* is mixed with *abhraka* in equal quantity and triturated with *mustā rasa* and *tanḍulīya rasa*. Then after making *cakrikās* sixty *puṭas* are advised to be given *ṭaṅkana* should be used once only. And by giving sixty *puṭas* *sindura* like colour develops in *abhraka bhasma*. This *abhrakabhasma* destroys *kuṣṭha* and *kṣaya* etc. disease definitely (21-22).

Fourth method: In this method *nāgaballudala rasa*, *vātamāla tvak rasa*, *vāsā rasa*, *matsyādānī* (*bhūdhātrī*), *matsyākṣī* (*brāhmī*), *punarnavā* and *vāṭamūla rasa* have been recommended for *mardana* (trituration) and same *puṭa* should be applied. The author mentions here that by 20 *puṭas* *sindūra* like colour appears in *abharaka bhasma* (23-24).

Note: That means three *puṭas* with each drug should be given. Though, in Gujrātī commentry by Jīvarāma Kālīdāsa it is written that 20 *puṭas* with each drug may be given and these are seven drugs so in total 140 *puṭas* are to be given.

Lastly the author gives general statement in the context of *abhrakabhasma* that by applying more number of *puṭas* the *bhasma* becomes fine to finer, *vāritara* and of shining red colour and develops *sarvarogahara* properties (25).

5.26-29. Pharmaco-therapeutic properties of *Abhraka bhasma*:

Mṛta vajrābhraka (*vajrābhraka bhasma*) should always be used internally by wise persons for destroying *balī*, and *palita* (wrinkles and graying of hairs) and to strengthen the body.

It is further claimed about *abhraka bhasma* that it is *tridoṣaśamana* (pacifies all the three *doṣas*), destroys all the *vyādhies*, stimulates digestive fire, sustains the discharge of *seman* and increases it in quality and quantity, destroys *mūtrakṛcchra* etc. Urinary troubles, prevents the onset of *bhūtonmāda*, improves *smṛti* (memory), destroys *sophāmaya* (oedematus conditions), immediately stimulates *prāṇa* (oxygen intake capacity of lungs), cures *jvara* (fevers) and advised to be used always (in all seasons) (26-28).

Special precautions:

Abharaka bhasma if used internally associated with *candrikā* (shining particles) proves *prāṇahṛt* (fetal) like that of *viṣa* (poison), *vajra* (weapon of Lord Indra), *śastra* (arms) and *agni* (fire) (29).

5.30-44. *Abhraka satvapātanam:*

First method: Purified *abhraka* should be mixed with 1-4th part *ṭaṅkaṇa* and triturated with *musalī rasa*, prepare pillets and dried. Put these in a *muṣa* and apply strong heat (of 1450°C), the heat should be increased slowly and maintained for one and half hours. In this way *satva* (metal content) of mica is liberated and settles at the base in button shape (30-31).

Method for Satva mārāṇa

This *satva* may be ground in a mortar and made into fine powder. Seive it with cloth piece and mix it with *ghee* and fry it in an iron pan for ten times. Frying should be done till it becomes red hot. After each frying it should be ground to fine powder and then again fried with *ghee*. Now add equal part of sulphur to it and triturate it with *vaṭamūla* decoction and apply twenty *varāha puṭas*. In the same way apply twenty *puṭas* with *triphalā* decoction. In the end apply *bhavana* with *nīlīrasa*, *guñjā kvātha*, *triphalā kvātha*, *pathyā kvāthā* and *mūlaka kvātha* and allow it to dry. It may be used internally and is claimed best for curing all the diseases (32-34½).

There is no better substance on the earth than *abhrasatva* and if it is heated hundred times in strong heat then it becomes like an *amṛta* (nectar) and may prove best for using in *deha* (body) and *loha* (metal) both (34½-36).

Second method: Prepare *dhānyābhraka* first and take 32 *palas* from it. Then take *lākṣā*, *guñja*, *kṣudra mīna*, *ṭaṅkaṇa*, goat's milk, *sarsapa*, *śigru*, *pinyāka*, *saindhava*, *mṛga-śṛṅga* and *mākṣika* (honey) in equal parts and prepare their mixture. Mix it with *dhānyābhraka* in equal quantity. It should then be triturated with *punarnavā*, *vāsā*, *kāsamarda*, *taṇḍulīya*, *matsyākṣī*, *haṃsapādī* and *kāravallī rasa*. Now also mix *khala* and *godhūma cūrṇa* with it in equal amount and prepare its *vatakas* (balls). Dry these and put these in *mūsa* and apply strong heat in a *koṣṭhī* using two blowers and *khadirāngāra* as fuel. By doing so the *satva* (metal content) of *abhraka* comes out (37-41).

Now collect the *kāṃsyavarṇa* (bronze colour) granules from the *kiṭṭa*. And then mix the remaining portion of *kiṭṭa* with *gomaya* and prepare its balls and heat them strongly after drying as before. By this method the remaining *satva* also comes out. The *kiṭṭa* may again be treated with *pañca gavya*, *pañcaja* and *mahiṣī pañcaka* for complete extraction of *satva* from the *kiṭṭa* portion. This is as true as *guru vacana/āptavacana* (42-44).

5.45-53. *Abhra satva māraṇa*:

Śodhana method: The granules of *abhra satva* may be treated with *amlavarga* drugs/liquids. Then it should be purified with *śodhanīya guṇa* drugs also in *mūsa*. The *kāca*, *ṭaṅkaṇa*, *guñja*, *ajya* and *śāragha* (honey) may also be used for *śodhana*. After *śodhana* these should be heated to red hot and quenched in honey, oil, fat and ghee. These induce softness in the *satva*. Then the granules of *satva* should be heated strongly and quenched in *kāñjika* and crush these immediately to make into powder with iron hammer. So made powder of *abhra satva*, may be fried in *ghee* for three times. Then so fried material should be powdered again on stone plate with care, then triturate it with *āmalkī patra rasa*, *āmalakī phala rasa*, *punarnavā rasa*, and *kāñjika* along with *gandhaka* and apply *puṭas* heat ten times. In this way *abhra satva bhasma* is prepared (45-50).

Properties: The *satva bhasma* on internal use prevents death, destroys all the diseases, specially *kṣaya*, *pāṇḍu*, *grahaṇī*, *svāsa*, *śūla*, *kāmalā*, *jvara*, *meha*, *kāśa*, *pañcavidha gulma*, *mandāgni*, *udararoga*, *arśa* and various types. By

using this mixture all diseases are cured and the importance of *abhra satva* is beyond in explanation (51-53).

5.54-59 Rajāvarta (Lapis lazuli) (II):

Characteristics

The best *rājāvarta* is that which is slightly reddish, bluish or mixed colours, heavy in weight and *masṛṇa* (smooth) on surface (54).

Śodhana (Purification)

It becomes purified by *svedana* (heating) in boiling with *kṣāra drava* (*gomutra*) and *amla drava* and repeating the process for three times (55).

Marāṇa (Incineration of Rajāvarta)

Mix *rājāvarta* with equal amount of sulphur and triturate it with *bhṛṅgarāja rasa* and applied *puṭa* heating (*ardhagajapuṭa*). The process should be repeated for seven times. In this way *rājāvarta bhasma* is prepared (56).

Pharmaco-Therapeutic Properties

It is *dīpana* (stimulates digestive fire), *pācana* (digestive) *vṛṣya* (aphrodisiac), *pacifies vāta doṣa* and *viśadoṣa*, destroys *kaphaja rogas*, *pramehas*, *arśas*, *pāṇḍu* and *kṣaya rogas* (57).

Satvapatana of Rajāvarta

Triturate *rājāvarta* with *kākamācī*, *ksīrakanda*, *bandhyākar-koṭakī*, *kośātakī*, *raja śamī*, *triphala* and *gṛhadhuma*, prepare its balls, dry these and put these in a *mūṣa* and apply strong heat with *khadirāṅgāra* using two blowers for blowing air (58-59).

5.60-68 Vaikrānta (Turmaline) (III):

Characteristics

That which has eight edges, eight facets, six angles, smooth surface, heavy weight and possesses pure or mixed colours. Such mineral is known as *vaikrānta* (60).

Varieties as per Colour

As per colour it is said to be of eight types viz. white, yellow, black, blue, pegin-colour, spotted with different colour spots, *śyāmala* and *miśra varṇa*. In this way it is of eight types (61).

Śodhana and Māraṇa Process

Śodhana is done by boiling it in *kulattha kvātha*. And for *māraṇa* it should be triturated with sulphur (equal part) and lemon juice and then applied *puṭa* heating. As the number of *puṭas* is not mentioned here apply seven *puṭas* (62).

Pharmaco-Therapeutic Properties

It is claimed as *tridoṣaghna*, *vṛṣya* (aphrodisiac), *āyuprada* (prolongs life span), *prāna prada* (life saving), *vegaprada* (movement promotor), *vīryakartā* (improves semen in quality and quantity), improves intelligence and complexion.

It is considered best amongst all the *rasayanas*, destroys diseases and is similar to diamond in properties. It also helps in *rasabandhana* (solidification of mercury) (63-64).

Satvapātana Method

It should be ground well with the drugs of *satvapātana gaṇa* and then prepare its dry balls, put these in the *mūṣā* and apply strong heat. In this way the *satva* (metal content) is liberated from *vaikrānta* (65-66½).

Method of Using Satva

Grind *vaikrānta satva* with equal part of *sūtabhasma* and equal part of *abhṛaka satva bhasma*. Mix all these with *kaṇa* (*pippalī*), *madhu* (honey) *ājya* (*ghee*), and use in one *balla* (2-3 *ratti*) dose (66½-67).

Pharmaco-Therapeutic Properties

Vaikrānta satva, used as above destroys all the diseases and makes the man to live hundred years with pleasure. If it is used continuously for three years *bali* (wrinkles) and *palita* (greying of hairs) are cured definitely (66½-68).

5.69-78 Sasyaka/Tuttha (Copper Sulphate) (IV):***Mythological Origin***

'*Garuḍa*' (a heaven bird) has drunken *hālāhala* poison and *amṛta* (nectar) simultaneously and vomited immediately. This vomited poison associated with *sudhā* (nectar) on *marakata* mountain when turned solid in due course of time became known as *sasyaka* (69).

Physical Appearance

That which is blue in colour, possess *marakata mani* (emerald) like shade and associated with *tejas* (brightness) is considered as superior *sasyaka* (69-70).

Śodhana Method

Sasyaka should be purified by applying *svedana* in *dolāyantra* either with buffalo urine, goat's urine, cows urine or man's urine for two *yāmas* (6 hrs.) (71)

Māraṇa Method

For *māraṇa sasyaka* should be mixed with equal part of sulphur and *ṭaṅkaṇa* and be triturated with *lakuca drava*. On drying close it in an *andhamūṣā* and apply seven *kukkuṭa puṭas*, by this method it converts into *bhasma* form (72).

Satvapātana Method

It should be mixed with *ṭaṅkaṇa* 1/4th part and ground with lemon juice. On drying it should be kept in a *mūṣā* and applied strong heating. By this method *sasyaka* liberates its *satva* (metal content) in the form of *tāmra* (Copper) (73).

Pharmaco-Therapeutic Properties of Sasyaka Bhasma

As it was mixed with *viṣa* and *amṛta* at the time of origin hence its properties are more than *viṣa*, just like a *sūdhā* which when associated with *viṣa* becomes more potent in properties than the plain *sūdhā* (74).

It can pacify *tridoṣas*, checks *viṣa prabhāva*, destroys *gudaśūla*, *amlapitta* and *vibandha* (constipation). And acts as best *rasāyana*. *Mayura tuttha* produces vomiting and purgation, destroys *svitrakuṣṭha* and also all the diseases (75-76).

Mudrikā (Ring) of Sasyaka Satva

For this mix *bhūnāga satva* with *sasyaka satva* in equal parts and prepare a ring by melting both together. It is claimed as *śūlagñī* (destroyer of pain) and may also prevent the effects of evil spirits and the effects of *carācara viṣa*. This ring should also be prepared and used for the protection of kings. According to the description of other texts the water kept in contact of this ring when used for drinking may destroy *udara śūla* (abdominal pain) immediately (77-78).

5.79-90. *Mākṣika (Pyrite) (V)*

Varieties: There are two varieties of *mākṣika* i.e.

(1) *Rukma (suvanṇa) mākṣika* and

(2) *Tāpya (rajata) mākṣika*

1. ***Suvanṇa mākṣika:*** The first variety is known as *suvanṇa-mākṣika*. It is produced from the mountains of *kānyakubja* area. It is very much similar to gold and contains the shade of nine colours of gold.

2. ***Tāpya mākṣika:*** The second variety is found on the banks of Tapti river and is known as *tāpya mākṣika*. It is associated with stony portion and looks *pāṇḍura* (whitish) in colour and associated with the shade of five colours of gold. It is comparatively inferior in properties and liberates less *satva* (metal content) on *satvapātana* (79-81).

Śodhana (Purification) method

Suvarṇa māḥṣika is purified by triturating it with cows urine, butter milk and *kulattha kvāthā* (82½).

Māraṇa (Incineration) method

After *śodhana* mix *gandhaka* with *suvarṇa māḥṣikas* and triturate it with *bījapūra* (a variety of lemon) juice, prepare its pilletes, close these in *śarāva saṃpuṭa* and apply heat with *varāhpuṭa*. Such five *puṭas* make its good quality *bhasma* (82½-83).

Satvapātana method

Put *suvarṇa māḥṣika* powder in an iron pan and heat it strongly stirring with an iron leddle till it converts red in colour like that of *dhātu (gairika)*. Now add lemon juice and grind it, also add three times mercury to it and grind it for one day. Filter it with strong and thick cloth. In this way extra mercury will go down and the *piṣṭi* will remain in the cloth. Filtering with cloth may be done for 2-3 times. Now take the *golaka* (bolus) of *piṣṭi* and place it in ‘*damaru yantra*’ and apply heat to it for 6 hours from down. By this way the red *satva*, similar to *indragopa* (a red insect) in colour may be collected from the lower part of the *yantra* according to expert (84-87½).

By this method *tāpya satva* can also be obtained. Its *satva* may also be obtained by mixing *tāpya* with *ṭaṅkaṇa* and heating it in *mūṣa* till melting. Then also copper like *satva* may be obtained. It may be used for *dehakarma* and *lohakarma* both and it is mentioned in *devīśāstra* (87½-89).

Properties of Makṣika satva

It can destroy all the diseases and may always prove as good as *amṛta* (nectar) for *pāradakarma* and *pārada* preparations. It proves helpful in mixing the metals with each other, and is best in *rasāyana* (90).

5.91-100 *Vimala* (Ironpyrite) (VI):

Varieties: *Vimala* is described to have three varieties:

1. *Hema Vimala*- possess golden colour.
2. *Rūpya Vimala*- looks like silver in colour.
3. *Kāmsya Vimala*- is similar to *kāmsya* (bell metal or bronz) in colour (91-92½).

Physical Properties

It is *snigdha* (greasy), *vartula* (cube like) and possess *ṣaṭkoṇas* (six angles) and is associated with *phalakas* (facetes) (92½).

Śodhana (Purification) method

Vimala becomes purified by grinding it with *vasā rasa*.

Maraṇa (Incineration) method

It should be ground first with sulphur (equal part) and lemon juice and then subjected to *puṭa* heating (93½).

In another method its *bhasma* can be prepared by giving 10 *puṭas* with *śṛṅga bhasma* (93½).

Satvapātana (Metal extraction) method

For this, *Vimala* should be ground with lemon juice and closed in the *mūṣa* and heated strongly to liberate its *satva* (metal content) which is similar to *sīsa* (lead) (94).

Satva Prayoga

Mix *pārada* equal to this *satva* and prepare their *piṣṭi*. Add sulphur and grind well, also mix three times *tālaka* (orpiment) and five times *manaḥ śilā* (realger) and apply heat for 2 days, then mix *rajata bhasma* and *vaikrānta bhasma* in equal amount and grind it well to make fine powder. Seive it with cloth, fill it in *kāca kūpi* and apply heat through *bālukā yantra* for eight *yāmas* (24 hours). On self cooling take it out and collect the material (*bhasma*) from the bottle (95-98½).

Dose

It should be used in one *balla* (2-3 *ratti*) quantity mixed with *vyoṣa* (*trikaṭu*) and honey (98½).

Uses and indications

It is specially indicated for children, may destroy *jvara*, *pāṇḍu*, *grahaṇī*, *kāmala*, *śūla*, *mandāgni*, *kṣaya-roga* and *pittaja rogas*. And by changing *anupānas* it may destroy all the diseases (98½-99½).

Bhasma Properties

Its *bhasma* is *vṛṣya* (aphrodisiac), best *rasāyana* and destroys *pitta* and *vata doṣa* or their diseases (99½-100).

5.101-115 Śilājatu (Mineral pitch/asphalt/ bituman) (VII):

One *versa* describing two main varieties of *śilājatu* based on smell, is missing in the original text. And the text starts with the description of first variety.

Varieties: According to other texts the *śilājatu* is mainly of two types such as:-

1. *Gomūtra gandhi* and
2. *Karpūra gandhi* (101)

The first variety is again subdivided in two varieties such as *sasatva* and *satvahīna*; of the two the first one is better in properties and is capable of destroying all the *doṣas* (102).

Origin of śilājatu

In summer season due to intense heat a few rocks of *Himalaya* mountain containing either gold, silver or copper may start oozing an exudates from some rocks. That is known as *śilājatu* and claimed to contain respective metals in it (103).

Hema garbha Śilājatu

The *śilājatu* produced from the gold containing rocks is similar to *bandhūkapuṣpa* in colour i.e. (yellowish). It is heavy, oily or greasy and very cool

in nature, acts as best *rasāyana*, contains *tikta* and *madhura rasas*, may pacify all the *doṣas* (104).

Raupya garbha śilājatu

The *śilājatu* produced from the silver containing rocks in *pāṇḍura* (whitish) in colour, *madhura* in *rasa* and cool in properties, may pacify *pittaja pāṇḍu* and destroys *kṣaya rogas* (105).

Śulva garbha śilājatu

The *śilājatu* produced from the copper containing rocks is black in colour, almost solid and heavy in form and weight. It may pacify *kapha* and *vāta doṣas* and can conquer all diseases.

There is no separate description of *lohagarbha śilājatu* in this text (106).

Tests for *Śilājatu*

1. If it is put on fire, it takes the shape of *liṅga* (penis).
2. It burns without producing smoke.
3. It should dissolve in water. Only such *śilājatu* is considered as real or pure *śilājatu* (107).

Śodhana Method

Śilājatu (that which is produced from the rocks) is purified by subjecting it to *svedana* (boiling in a *bhanda*) containing either *amla-drava*, or *kṣāradrava* associated with *guggulu* for two *ghatikas* (6 hors) (108).

Māraṇa Method

Śilājatu treated (trituated) either with *manaḥ śilā* and *matuluṅga rasa*, *manaḥ śilā* and *gandhka*, or *ṭalaka* and then subjected to *puṭa* heating using *laghupuṭa* with eight cowdung cakes (109).

Pharmaco-Therapeutic Properties of Śilājatu

The man who always uses purified *śilājatu* lives for hundred years in good health and never suffers with any disease and these persons are never get affected with *mūtrakṛccha* and *aśmarī* etc. urinary disorders (110-111½).

Whatever properties have been found by the wise persons in *mahārasas*, *uparasas*, *dhātus*, *ratnas* and in *pārada* or its compounds all those properties are claimed to be present in *śilājatu* (*śilā dhatu*) also (111½-112).

Śilājatu Prayoga Vidhi

Śilājatu in purified or *bhasma* form should be used in one *balla* (2-3 *gunja*) dose mixed with *vaikrānta bhasma*, *kānta bhasma*, *triphalā* and *trikaṭu cūrṇa* to destroy all types of *rogas*. Not only diseases are cured but its use can also prevent *palita* (greying of hairs) alongwith *balies* (wrinkles) without any doubt (113).

Karpūra Śilājatu

Karpūra śilājatu is white like *karpūra* (camphor). It destroys *aśmarī*, *meha* (*premeha*) and *mūtrakṛcchra*, *kāmalā* and *paṇḍu* (114).

Śodhana

For *śodhana* *karpūra śilājatu* should be subjected to *svedana* with any *amla drava* for 3 hours and then dried.

Its *māraṇa* and *satvapatana* are not mentioned by experts (115).

5.116-130 Rasaka/Kharpara (Zinc ore/calamine) (VIII):

Varieties: *Rasaka* is of two types, viz:

1. *Kāravellaka*; and 2. *Dardura*

The first variety is used for *satvapātana* purpose while second one is used for preparing medicines. Both the varieties are considered as *sarvamehahare* [destroys all types of *meha* (urinary) *rogas*] and *pitta śleṣma vināśana* (pacifies *pitta doṣa* and *kaphadoṣa*) (116-117½).

Nāgārjuna the father of Indian alchemy (*rasavāda*) had claimed that *sūta* (mercury) and *kharpara* (zinc ore) both if made *agnisaha* (thermostable) then these are considered as the best of all *rasas* (*mahārasas*) and those who have succeeded in this, for them it is easy to achieve *svaṛṇa mayī siddhi* (gold making knowledge). There is no doubt in it (117½-118).

It means in *rasavāda* (alchemy) *rasa* (mercury) and *rasaka* (zinc ores) are the most important drugs to achieve success in gold making.

Śodhana Method

Heat *rasaka* strongly on fire and quench it in *bījapūra* (lemon) juice for seven times. And this treatment makes it purified. It may also be purified by melting *kharpara/rasaka* and pouring in *kāñjika*, *takra*, *nara mūtra* or *meṣa mūtra* (119-120).

Rañjana of Tāmra with Kharpara

Make a fine powder of purified *kharpara* through a *reti* (file) and keep it in man's urine for one month and then mix it with *tāmra* (copper) to give colour (die) to it like a gold (121).

Satvapātana

Mix *kharpara cūrṇa* with *śilā* (realger), *haridrā*, *triphalā*, *gṛhadhūma*, *saindhava*, *bhallātaka* and *tañkaṇa*, in 1/4th part (quantity) and triturate it with *ksāra* and *amala drava*. On drying fill it in *br̥tnāka mūṣa*, close it and seal it. Place this *mūṣa* in another *mūṣa* and apply strong heat. When white or bluish flame starts to come out then take out the *mūṣa* through a *loha sandansi* (forcep) and tilt it downward to let the *satva* come out on the earth protecting the *mūṣa* tube. Its *satva* is like a *sīsa* (lead). Repeat the process for three times and by doing so total *satva* (metallic content) comes out from the *rasaka*. This has been said by my teacher says the author himself (122-126).

***Māraṇa* Method**

Mix *talaka* with this *satva* in equal amount and put it in a *kharpara* (iron pan) and heat it rubbing the metal (*satva*) and *talaka* with an iron leddle slowly till the whole metal turns into an dash form. It is without any doubt (127).

Method of using *Satvabhasma*

Mix *mṛta satva* (*satva bhasma*) and *kānta bhasma* in equal amount. Take one *maṣaka* (about one gram) of this powder, mix it with *varā kvātha*, Keep it over night in an iron pot, put *tila taila* as *pratīvāpa* over it and then it may be used to cure *madhumeha*, *kṣaya*, *paṇḍu*, *vātavyādhi*, *yoniroga* of ladies, *viśamajvara* and all the *rogas* of ladies specially *śvāsa* and *kāsa* (128-130).
